The Problem

There is little focus or materials available in Muslim communities regarding advance care planning (ACP) or death and dying.

Purpose

To develop a culturally sensitive community engagement program on ACP and assess readiness to complete ACP documents post session completion.

Background/Literature Review

A literature search from 2010 - 2020 provided little information regarding ACP in Muslim communities in the United States. Generalized projects directed towards minority and underserved communities suggest there may be interest if information was available.

Methods

In March 2020, a 20-minute PowerPoint presentation and handout were provided at a Southern California Muslim community center discussing the importance of ACP and choosing a healthcare proxy. This was followed by a 1½-hour Q&A session with a panel of four healthcare experts (critical care physician, chaplain, emergency room nurse, and pediatric intensive care nurse); three panelists were Muslim.

Attendees were invited to complete the ACP-4 Engagement Survey post program.

Results

- 17/24 attendees completed the survey
- 82% female; mean age 44 years (range 19-75)
- Diverse race and ethnicity, representing 6 different countries
- 94% thought the program was effective
- 52.9% were contemplating completing ACP paperwork in the next 6 months
- 35.6% had already completed ACP

Limitations

- Single Institution
- Class has not been repeated
- Class has not been repeated

Conclusions

Muslims effectively engaged in ACP discussions, demonstrated readiness to complete ACP, and would like to see more presentations about the topic in their mosques. The format of a short presentation followed by a Q&A with a diverse panel of healthcare experts was well received and allowed for various perspectives to be heard. This model can be adapted by other religious, spiritual, or community settings to improve ACP in underserved populations.

Considerations for Muslims regarding advance care planning, end of life, palliative care, and hospice

Basic Considerations

- 17/24 attendees completed the survey
- 82% female; mean age 44 years (range 19-75)
- Diverse race and ethnicity, representing 6 different countries
- 94% thought the program was effective
- 52.9% were contemplating completing ACP paperwork in the next 6 months
- 35.6% had already completed ACP
